

## Sand and water:

I separated the materials <sup>SP</sup> by letting the water seep through the filter paper and only the sand was on the filter paper.

## Water and sugar:

I separated the materials by putting heat under the water and sugar and then the water evaporated and only sugar was in the container.

### Deep Challenge:

Is there a way to recover water after recovering a substance from a solution after evaporation? Prove it.

Yes because if you find a way to trap the water vapour like in a tube it will condense and turn back into water. if you want to collect it.

Excellent (TP)
